

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

Picoides americanus dorsalis. ALPINE THREE-TOED WOODPECKER.— One was observed on the pine mesas near Boulder at an elevation of about 5800 feet on December 17, 1911, and on January 7, 1912 (probably the same individual).

Asyndesmus lewisi. LEWIS'S WOODPECKER.— A few birds remain all winter in the orchards and cottonwoods of the plains in Boulder Co. I have a few records for December, February, and March.

Zonotrichia leucophrys gambeli. GAMBEL'S SPARROW.— During the three past winters I have observed a small flock of Gambel's Sparrows wintering near a sheltered outcrop of sandstone on the plains east of Boulder. A specimen was taken for record on February 18, 1912.

Melospiza melodia montana. MOUNTAIN SONG SPARROW.— I have found this sparrow at Tolland, 9000 feet, in the middle of July, though not as numerous as the white-crowned and Lincoln's Sparrow which frequent that Park in large numbers.

Bombycilla cedrorum. CEDAR WAXWING.— On September 9, 1910, with Mr. H. C. Williams, I saw five or six in City Park, Denver. On September 11, 1910, in Boulder Cañon, near Boulder, I saw three Cedar Waxwings feeding on the berries of crataegus. These are the only records of this species that I have.

Dendroica townsendi. TOWNSEND'S WARBLER.— In September, during the fall migration, I have found this warbler to be not uncommon in Boulder Co. I have noted it in varying numbers from August 28 to September 28.

Catherpes mexicanus conspersus. CAÑON WREN.— A nest with young was found on July 23, 1911, in the same crevice that contained the nest recorded in 'The Auk,' 1911.—NORMAN DEW. BETTS, *Boulder, Colo.*

Correction.— We regret very much to state that two of the records published in our 'Notes from Eastern Alberta,' Auk, Vol. 28, No. 4, Oct., 1911, have since proved erroneous: *Steganopus tricolor* proved referable to *Lobipes lobatus*, and *Macrorhamphus griseus griseus* to *scolopaceus*. Prof. W. W. Cooke kindly determined these specimens.

We moreover do not wish to be responsible for the three following records,—*Ammodramus savannarum bimaculatus*, *Anthus spraguei*, and *Icterus spurius*, as they are apparently new for Alberta (Prof. W. W. Cooke *in litteris*). These records are obviously of no value as we did not save the skins, but depended upon the more or less brief descriptions of a handbook in identifying them.—WINTHROP S. BROOKS, and STANLEY COBB, *Milton, Mass.*

Birds and the Cotton Scale.— I notice in the January Auk, p. 113, an account of birds eating the "Chinese Cotton Scale" in Colorado Springs. Why 'Chinese' I do not know; the insect in question is *Pulvinaria innumerabilis* Rathvon, common in the United States. Sanders has recently considered it identical with the European *P. vitis*, but it is probably distinct,
